- The talk could also be given the title Scheme Theory for Discrete Mathematicians.
- Hilbert is supposed to have had an interest in an "elementary" approach to algebraic geometry. Here elementary is in the sense of logic and not number theory.

Finite sets have the following properties:

Finite sets have the following properties:

1. There are "special" finite sets **1** (singleton) and **0** (empty) so that there are *unique* maps $z_A : \mathbf{0} \to A$ and $s_A : A \to \mathbf{1}$ for any finite set A.

Finite sets have the following properties:

- 1. There are "special" finite sets **1** (singleton) and **0** (empty) so that there are *unique* maps $z_A : \mathbf{0} \to A$ and $s_A : A \to \mathbf{1}$ for any finite set A.
- 2. Given finite sets A and B, the collection of maps hom(A, B) is another finite set. Similarly, the disjoint union $A \coprod B$ and the product $A \times B$ are finite sets.

Finite sets have the following properties:

- 1. There are "special" finite sets $\mathbf{1}$ (singleton) and $\mathbf{0}$ (empty) so that there are *unique* maps $z_A : \mathbf{0} \to A$ and $s_A : A \to \mathbf{1}$ for any finite set A.
- 2. Given finite sets A and B, the collection of maps hom(A, B) is another finite set. Similarly, the disjoint union $A \coprod B$ and the product $A \times B$ are finite sets.
- Given maps p : A → C and q : B → C we can form the fibred product A ×_C B consisting consisting of pairs (a, b) where p(a) = q(b). This too is a finite set.

Finite sets have the following properties:

- 1. There are "special" finite sets **1** (singleton) and **0** (empty) so that there are *unique* maps $z_A : \mathbf{0} \to A$ and $s_A : A \to \mathbf{1}$ for any finite set A.
- 2. Given finite sets A and B, the collection of maps hom(A, B) is another finite set. Similarly, the disjoint union $A \coprod B$ and the product $A \times B$ are finite sets.
- Given maps p : A → C and q : B → C we can form the fibred product A ×_C B consisting consisting of pairs (a, b) where p(a) = q(b). This too is a finite set.
- We have a special set Ω (doublet) and an inclusion 1 → Ω so that each subset S of a set A is of the form A ×_Ω 1 for a suitable map s : A → Ω. It follows that the power set P(A) = hom(A, Ω) of a finite set is also a finite set.

Category-theorists will summarise the above by saying that finite sets form a *topos*. Recall the notion of a *category*.

4. We have the identity $f \circ 1_A = f = 1_B \circ f$.

Category-theorists will summarise the above by saying that finite sets form a *topos*. Recall the notion of a *category*.

- 1. A category has objects and morphisms between objects.
- 2. Each object A has a morphism $1_A : A \to A$ called the identity morphism.
- 3. Morphisms $f : A \rightarrow B$ and $g : B \rightarrow C$ can be composed to obtain a morphism $g \circ f : A \rightarrow C$.

- 4. We have the identity $f \circ 1_A = f = 1_B \circ f$.
- 5. Composition of morphisms is associative.

An *elementary topos* is a category with some additional properties. First of all we have:

An *elementary topos* is a category with some additional properties. First of all we have:

1. There is a special object $\mathbf{1}$ so that each object A has a unique morphism $A \rightarrow \mathbf{1}$.

An *elementary topos* is a category with some additional properties. First of all we have:

- 1. There is a special object $\mathbf{1}$ so that each object A has a unique morphism $A \rightarrow \mathbf{1}$.
- Given morphisms p: A → C and q: B → C, there is an object A×_C B with morphisms π_A: A×_C B → A and π_B: A×_C B → B so that p ∘ π_A = q ∘ π_B. Moreover, given an object T and morphisms f: T → A and g: T → B so that p ∘ f = q ∘ g, there is a *unique* morphism (f,g): T → A×_C B so that π_A ∘ (f,g) = f and π_B ∘ (f,g) = g.

An *elementary topos* is a category with some additional properties. First of all we have:

- 1. There is a special object $\mathbf{1}$ so that each object A has a unique morphism $A \to \mathbf{1}$.
- 2. Given morphisms $p : A \to C$ and $q : B \to C$, there is an object $A \times_C B$ with morphisms $\pi_A : A \times_C B \to A$ and $\pi_B : A \times_C B \to B$ so that $p \circ \pi_A = q \circ \pi_B$. Moreover, given an object T and morphisms $f : T \to A$ and $g : T \to B$ so that $p \circ f = q \circ g$, there is a *unique* morphism $(f,g) : T \to A \times_C B$ so that $\pi_A \circ (f,g) = f$ and $\pi_B \circ (f,g) = g$.

These two are equivalent to the assertion that *finite limits exist* in the sense of category theory.

Power Sets

In addition, for every object A we have a power object $(P(A), S_A)$ where S_A is a sub-object of $A \times P(A)$ (the latter is defined once there are limits!).

This has the property that given a relation $R \subset A \times B$ (here \subset indicates a monomorphism) between B and A there is a unique morphism $c_R : B \to P(A)$ so that R is canonically isomorphic to $S_A \times_{A \times P(A)} (A \times B)$.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

▶ The **0** object with a unique morphism to every object.

Some "standard" categorical algebra allows one to deduce from these properties all the other properties of finite sets mentioned above. In other words, the existence of the following.

- ► The **0** object with a unique morphism to every object.
- The amalgamation or join of a : C → A and b : C → B to give an object A ∨_C B.

Some "standard" categorical algebra allows one to deduce from these properties all the other properties of finite sets mentioned above. In other words, the existence of the following.

- ▶ The **0** object with a unique morphism to every object.
- The amalgamation or join of a : C → A and b : C → B to give an object A ∨_C B.
- The sub-object classifier Ω. (Warning: This is not the doublet in a general topos even when 1 is thought of as a singleton.)

Some "standard" categorical algebra allows one to deduce from these properties all the other properties of finite sets mentioned above. In other words, the existence of the following.

- ▶ The **0** object with a unique morphism to every object.
- The amalgamation or join of a : C → A and b : C → B to give an object A ∨_C B.
- The sub-object classifier Ω. (Warning: This is not the doublet in a general topos even when 1 is thought of as a singleton.)

► The object hom(A, B) classifying morphisms A → B.

Some "standard" categorical algebra allows one to deduce from these properties all the other properties of finite sets mentioned above. In other words, the existence of the following.

- The 0 object with a unique morphism to every object.
- The amalgamation or join of a : C → A and b : C → B to give an object A ∨_C B.
- The sub-object classifier Ω. (Warning: This is not the doublet in a general topos even when 1 is thought of as a singleton.)

• The object hom(A, B) classifying morphisms $A \rightarrow B$.

Note that **0** is *deduced* unlike traditional set theory!

Monoid and Groups

A monoid object in a topos is (M, e, m) where $e : \mathbf{1} \to M$ is the identity "element" and $m : M \times M \to M$ is the multiplication. The usual axioms for a monoid can be written as follows:

Monoid and Groups

A monoid object in a topos is (M, e, m) where $e : \mathbf{1} \to M$ is the identity "element" and $m : M \times M \to M$ is the multiplication. The usual axioms for a monoid can be written as follows:

$$egin{aligned} m \circ (e \circ s_A, 1_M) = m \circ (1_M, e \circ s_A) = & 1_M \ m \circ (1_M imes m) = m \circ (m imes 1_M) \end{aligned}$$

Monoid and Groups

A monoid object in a topos is (M, e, m) where $e : \mathbf{1} \to M$ is the identity "element" and $m : M \times M \to M$ is the multiplication. The usual axioms for a monoid can be written as follows:

$$egin{aligned} m \circ (e \circ s_A, 1_M) = m \circ (1_M, e \circ s_A) = & 1_M \ m \circ (1_M imes m) = m \circ (m imes 1_M) \end{aligned}$$

Note that a monoid can also be thought of as a single object A with morphisms M as a sub-object of hom(A, A) which contains 1_A and is closed under composition.
Monoid and Groups

A monoid object in a topos is (M, e, m) where $e : \mathbf{1} \to M$ is the identity "element" and $m : M \times M \to M$ is the multiplication. The usual axioms for a monoid can be written as follows:

$$egin{aligned} m \circ (e \circ s_A, 1_M) = m \circ (1_M, e \circ s_A) = & 1_M \ m \circ (1_M imes m) = m \circ (m imes 1_M) \end{aligned}$$

Note that a monoid can also be thought of as a single object A with morphisms M as a sub-object of hom(A, A) which contains 1_A and is closed under composition.

A group object is a monoid together with a morphism $\iota: M \to M$ representing the inverse. It satisfies

Monoid and Groups

A monoid object in a topos is (M, e, m) where $e : \mathbf{1} \to M$ is the identity "element" and $m : M \times M \to M$ is the multiplication. The usual axioms for a monoid can be written as follows:

$$egin{aligned} m \circ (e \circ s_A, 1_M) = m \circ (1_M, e \circ s_A) = & 1_M \ m \circ (1_M imes m) = m \circ (m imes 1_M) \end{aligned}$$

Note that a monoid can also be thought of as a single object A with morphisms M as a sub-object of hom(A, A) which contains 1_A and is closed under composition.

A group object is a monoid together with a morphism $\iota: M \to M$ representing the inverse. It satisfies

$$m \circ (1_M, \iota) = m \circ (\iota, 1_M) = e \circ s_A$$

Monoid and Groups

A monoid object in a topos is (M, e, m) where $e : \mathbf{1} \to M$ is the identity "element" and $m : M \times M \to M$ is the multiplication. The usual axioms for a monoid can be written as follows:

$$egin{aligned} m \circ (e \circ s_A, 1_M) = m \circ (1_M, e \circ s_A) = & 1_M \ m \circ (1_M imes m) = m \circ (m imes 1_M) \end{aligned}$$

Note that a monoid can also be thought of as a single object A with morphisms M as a sub-object of hom(A, A) which contains 1_A and is closed under composition.

A group object is a monoid together with a morphism $\iota: M \to M$ representing the inverse. It satisfies

$$m \circ (1_M, \iota) = m \circ (\iota, 1_M) = e \circ s_A$$

In the topos of finite sets, this gives the notion of a finite group.

A ring object in a topos a (R, e, z, m, a) where (R, e, m) is a monoid and (R, z, a) is a group with the distributive law

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

A ring object in a topos a (R, e, z, m, a) where (R, e, m) is a monoid and (R, z, a) is a group with the distributive law

$$m \circ (\pi_1, a \circ \pi_{23}) = a \circ (m \circ \pi_{12}, m \circ \pi_{13})$$
$$m \circ (a \circ \pi_{12}, \pi_3) = a \circ (m \circ \pi_{13}, m \circ \pi_{23})$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

A ring object in a topos a (R, e, z, m, a) where (R, e, m) is a monoid and (R, z, a) is a group with the distributive law

$$m \circ (\pi_1, a \circ \pi_{23}) = a \circ (m \circ \pi_{12}, m \circ \pi_{13})$$
$$m \circ (a \circ \pi_{12}, \pi_3) = a \circ (m \circ \pi_{13}, m \circ \pi_{23})$$

As usual we can define the notion of monoid homomorphisms, group homomorphisms and ring homomorphisms.

A ring object in a topos a (R, e, z, m, a) where (R, e, m) is a monoid and (R, z, a) is a group with the distributive law

$$m \circ (\pi_1, a \circ \pi_{23}) = a \circ (m \circ \pi_{12}, m \circ \pi_{13})$$
$$m \circ (a \circ \pi_{12}, \pi_3) = a \circ (m \circ \pi_{13}, m \circ \pi_{23})$$

As usual we can define the notion of monoid homomorphisms, group homomorphisms and ring homomorphisms. This leads us to the definition of the *subcategories* of monoid objects, group objects and ring objects where morphisms are restricted to homomorphisms of that particular type.

(日) (同) (三) (三) (三) (○) (○)

A ring object in a topos a (R, e, z, m, a) where (R, e, m) is a monoid and (R, z, a) is a group with the distributive law

$$m \circ (\pi_1, a \circ \pi_{23}) = a \circ (m \circ \pi_{12}, m \circ \pi_{13})$$
$$m \circ (a \circ \pi_{12}, \pi_3) = a \circ (m \circ \pi_{13}, m \circ \pi_{23})$$

As usual we can define the notion of monoid homomorphisms, group homomorphisms and ring homomorphisms. This leads us to the definition of the *subcategories* of monoid objects, group objects and ring objects where morphisms are restricted to homomorphisms of that particular type.

This gives us the categories \mathcal{M} of finite monoids, \mathcal{G} of finite groups, \mathcal{R} of finite rings and \mathcal{C} of commutative finite rings.

A functor F from a category C to another category D is an assignment of an object F(A) in the second category to an object A in the first category and a morphism $F(f) : F(A) \to F(B)$ to a morphism $f : A \to B$ in the first category.

A functor F from a category C to another category D is an assignment of an object F(A) in the second category to an object A in the first category and a morphism $F(f) : F(A) \to F(B)$ to a morphism $f : A \to B$ in the first category. Moreover, we must have $F(1_A) = 1_{F(A)}$ and $F(g \circ f) = F(g) \circ F(f)$.

A functor F from a category C to another category D is an assignment of an object F(A) in the second category to an object A in the first category and a morphism $F(f) : F(A) \to F(B)$ to a morphism $f : A \to B$ in the first category. Moreover, we must have $F(1_A) = 1_{F(A)}$ and $F(g \circ f) = F(g) \circ F(f)$. We are interested in functors from the subcategory C of

commutative finite rings to the category of finite sets.

A functor F from a category C to another category D is an assignment of an object F(A) in the second category to an object A in the first category and a morphism $F(f) : F(A) \to F(B)$ to a morphism $f : A \to B$ in the first category. Moreover, we must have $F(1_A) = 1_{F(A)}$ and $F(g \circ f) = F(g) \circ F(f)$. We are interested in functors from the subcategory C of commutative finite rings to the category of finite sets. Schemes of

finite type (over \mathbb{Z}) will be represented as such functors.

A functor F from a category C to another category D is an assignment of an object F(A) in the second category to an object A in the first category and a morphism $F(f) : F(A) \to F(B)$ to a morphism $f : A \rightarrow B$ in the first category. Moreover, we must have $F(1_A) = 1_{F(A)}$ and $F(g \circ f) = F(g) \circ F(f).$ We are interested in functors from the subcategory C of commutative finite rings to the category of finite sets. Schemes of finite type (over \mathbb{Z}) will be represented as such functors. One such functor is the *forgetful* functor which "forgets" everything except the underlying finite set R.

A functor F from a category C to another category D is an assignment of an object F(A) in the second category to an object A in the first category and a morphism $F(f) : F(A) \to F(B)$ to a morphism $f : A \rightarrow B$ in the first category. Moreover, we must have $F(1_A) = 1_{F(A)}$ and $F(g \circ f) = F(g) \circ F(f).$ We are interested in functors from the subcategory C of commutative finite rings to the category of finite sets. Schemes of finite type (over \mathbb{Z}) will be represented as such functors. One such functor is the *forgetful* functor which "forgets" everything except the underlying finite set R. This will represent the affine line \mathbb{A}^1 .

Given two functors X and Y from C to finite sets, we can form the product $X \times Y$ which takes a finite commutative ring A to $X(A) \times Y(A)$.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Given two functors X and Y from C to finite sets, we can form the product $X \times Y$ which takes a finite commutative ring A to $X(A) \times Y(A)$. This allows us to define \mathbb{A}^n as the *n*-fold product of \mathbb{A}^1 with itself.

Given two functors X and Y from C to finite sets, we can form the product $X \times Y$ which takes a finite commutative ring A to $X(A) \times Y(A)$. This allows us to define \mathbb{A}^n as the *n*-fold product of \mathbb{A}^1 with itself.

We can now define the affine scheme $V(X_1, \ldots, X_p; f_1, \ldots, f_q)$ as

$$V(X_1,...,X_p; f_1,...,f_q)(A) = \{(a_1,...,a_p)|f_i(a_1,...,a_p) = 0, \forall i\}$$

Given two functors X and Y from C to finite sets, we can form the product $X \times Y$ which takes a finite commutative ring A to $X(A) \times Y(A)$. This allows us to define \mathbb{A}^n as the *n*-fold product of \mathbb{A}^1 with itself.

We can now define the affine scheme $V(X_1, \ldots, X_p; f_1, \ldots, f_q)$ as

$$V(X_1,...,X_p; f_1,...,f_q)(A) = \{(a_1,...,a_p)|f_i(a_1,...,a_p) = 0, \forall i\}$$

Note that this definition by "set comprehension" makes sense in any topos as long as f_i are polynomials with integer coefficients.

Given two functors X and Y from C to finite sets, we can form the product $X \times Y$ which takes a finite commutative ring A to $X(A) \times Y(A)$. This allows us to define \mathbb{A}^n as the *n*-fold product of \mathbb{A}^1 with itself.

We can now define the affine scheme $V(X_1, \ldots, X_p; f_1, \ldots, f_q)$ as

$$V(X_1,...,X_p; f_1,...,f_q)(A) = \{(a_1,...,a_p)|f_i(a_1,...,a_p) = 0, \forall i\}$$

Note that this definition by "set comprehension" makes sense in any topos as long as f_i are polynomials with integer coefficients. Further, note that the product of affine schemes is also an affine scheme

$$V(X_1,...,X_p; f_1,...,f_q) \times V(Y_1,...,Y_k; g_1,...,g_l) = V(X_1,...,X_p,Y_1,...,Y_k; f_1,...,f_q,g_1,...,g_l)$$

・ロト・西ト・ヨト・ヨー シック

A morphism (natural transformation) $f : X \to Y$ between two functors is an assignment of a morphism $f(A) : X(A) \to Y(A)$ so that various obvious diagrams commute.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

A morphism (natural transformation) $f : X \to Y$ between two functors is an assignment of a morphism $f(A) : X(A) \to Y(A)$ so that various obvious diagrams commute.

A closed sub-scheme of $Y = V(X_1, \ldots, X_p; f_1, \ldots, f_q)$ an affine scheme of the form $X = V(X_1, \ldots, X_p; f_1, \ldots, f_q, \ldots, f_q)$.

A morphism (natural transformation) $f : X \to Y$ between two functors is an assignment of a morphism $f(A) : X(A) \to Y(A)$ so that various obvious diagrams commute.

A closed sub-scheme of $Y = V(X_1, ..., X_p; f_1, ..., f_q)$ an affine scheme of the form $X = V(X_1, ..., X_p; f_1, ..., f_q, ..., f'_q)$. We define a morphism $f : X \to Y$ of affine schemes to be a

morphism of functors so that the graph Γ_f is a closed sub-scheme of $X \times Y$.

A morphism (natural transformation) $f : X \to Y$ between two functors is an assignment of a morphism $f(A) : X(A) \to Y(A)$ so that various obvious diagrams commute.

A closed sub-scheme of $Y = V(X_1, \ldots, X_p; f_1, \ldots, f_q)$ an affine scheme of the form $X = V(X_1, \ldots, X_p; f_1, \ldots, f_q, \ldots, f_q')$.

We define a morphism $f : X \to Y$ of affine schemes to be a morphism of functors so that the graph Γ_f is a closed sub-scheme of $X \times Y$.

In order to validate this definition we need to compare it with the usual one.

An affine group scheme is a functor from C to finite groups such that the underlying set-valued functor is an affine scheme.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

An affine group scheme is a functor from C to finite groups such that the underlying set-valued functor is an affine scheme. For example, we can send each finite ring to the underlying additive group which gives the additive group \mathbb{G}_a .

An affine group scheme is a functor from C to finite groups such that the underlying set-valued functor is an affine scheme. For example, we can send each finite ring to the underlying additive group which gives the additive group \mathbb{G}_a . A vector group scheme over S is the fibre product of:

An affine group scheme is a functor from C to finite groups such that the underlying set-valued functor is an affine scheme. For example, we can send each finite ring to the underlying additive group which gives the additive group \mathbb{G}_a . A vector group scheme over S is the fibre product of:

▶ The "zero section" $z : S \to \mathbb{G}_a^q \times S$ which sends *s* to (z, s).

An affine group scheme is a functor from C to finite groups such that the underlying set-valued functor is an affine scheme. For example, we can send each finite ring to the underlying additive group which gives the additive group \mathbb{G}_a . A vector group scheme over S is the fibre product of:

• The "zero section" $z: S \to \mathbb{G}_a^q \times S$ which sends s to (z, s).

• A "fibre-wise linear" morphism $I : \mathbb{G}_a^p \times S \to \mathbb{G}_a^q \times S$.

An affine group scheme is a functor from C to finite groups such that the underlying set-valued functor is an affine scheme. For example, we can send each finite ring to the underlying additive group which gives the additive group \mathbb{G}_a . A vector group scheme over S is the fibre product of:

▶ The "zero section" $z : S \to \mathbb{G}_a^q \times S$ which sends s to (z, s).

• A "fibre-wise linear" morphism $I : \mathbb{G}_a^p \times S \to \mathbb{G}_a^q \times S$.

If $S = V(X_1, \ldots, X_p; f_1, \ldots, f_q)$ then we can take *I* to be a matrix with entries as polynomials in the variables X_1, \ldots, X_q .

An affine group scheme is a functor from C to finite groups such that the underlying set-valued functor is an affine scheme. For example, we can send each finite ring to the underlying additive group which gives the additive group \mathbb{G}_a . A vector group scheme over S is the fibre product of:

• The "zero section" $z: S \to \mathbb{G}_a^q \times S$ which sends s to (z, s).

• A "fibre-wise linear" morphism $I : \mathbb{G}_a^p \times S \to \mathbb{G}_a^q \times S$.

If $S = V(X_1, \ldots, X_p; f_1, \ldots, f_q)$ then we can take *I* to be a matrix with entries as polynomials in the variables X_1, \ldots, X_q .

The importance of vector group schemes over S is that it is the *dual* category of the "usual" category Coh(S) of coherent sheaves on S.

The category of schemes of finite type can be constructed in the usual way by "patching".

The category of schemes of finite type can be constructed in the usual way by "patching". So also the category of coherent sheaves on such schemes.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

The category of schemes of finite type can be constructed in the usual way by "patching". So also the category of coherent sheaves on such schemes.

This completes the construction of the basic objects of algebraic geometry (as for example in Hartshorne's Chapters 1 and 2) upto the finite type and coherence assumption.

The category of schemes of finite type can be constructed in the usual way by "patching". So also the category of coherent sheaves on such schemes.

This completes the construction of the basic objects of algebraic geometry (as for example in Hartshorne's Chapters 1 and 2) upto the finite type and coherence assumption.

In principle, it would be possible to define more general schemes in terms of "ind" and "proj" limits. However, since we do not have an infinite object in our category, this would not make sense! The same applies to quasi-coherent sheaves.

The category of schemes of finite type can be constructed in the usual way by "patching". So also the category of coherent sheaves on such schemes.

This completes the construction of the basic objects of algebraic geometry (as for example in Hartshorne's Chapters 1 and 2) upto the finite type and coherence assumption.

In principle, it would be possible to define more general schemes in terms of "ind" and "proj" limits. However, since we do not have an infinite object in our category, this would not make sense! The same applies to quasi-coherent sheaves.

It remains to be seen whether all or most proofs in algebraic geometry can be achieved within the topos of finite sets!

Justification

The usual definition of a morphism

$$V(X_1,\ldots,X_p;f_1,\ldots,f_q) \rightarrow V(Y_1,\ldots,Y_k;g_1,\ldots,g_l)$$
The usual definition of a morphism

$$V(X_1,\ldots,X_p;f_1,\ldots,f_q) \rightarrow V(Y_1,\ldots,Y_k;g_1,\ldots,g_l)$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

is to give polynomials $h_i(X_1, \ldots, X_p)$ for $i = 1, \ldots, k$ such that $g_i(h_1, \ldots, h_k)$ lies in the ideal generated by f_i .

The usual definition of a morphism

$$V(X_1,\ldots,X_p;f_1,\ldots,f_q) \rightarrow V(Y_1,\ldots,Y_k;g_1,\ldots,g_l)$$

is to give polynomials $h_i(X_1, \ldots, X_p)$ for $i = 1, \ldots, k$ such that $g_j(h_1, \ldots, h_k)$ lies in the ideal generated by f_i . One can show that the earlier definition is equivalent to this one:

The usual definition of a morphism

$$V(X_1,\ldots,X_p;f_1,\ldots,f_q) \rightarrow V(Y_1,\ldots,Y_k;g_1,\ldots,g_l)$$

is to give polynomials $h_i(X_1, \ldots, X_p)$ for $i = 1, \ldots, k$ such that $g_j(h_1, \ldots, h_k)$ lies in the ideal generated by f_i . One can show that the earlier definition is equivalent to this one:

1. We can show that the morphism $\Gamma_f \to X$ is quasi-finite and that the morphism $\Gamma_f \times \mathbb{A}^1 \to X \times \mathbb{A}^1$ is quasi-finite.

The usual definition of a morphism

$$V(X_1,\ldots,X_p;f_1,\ldots,f_q) \rightarrow V(Y_1,\ldots,Y_k;g_1,\ldots,g_l)$$

is to give polynomials $h_i(X_1, \ldots, X_p)$ for $i = 1, \ldots, k$ such that $g_j(h_1, \ldots, h_k)$ lies in the ideal generated by f_i . One can show that the earlier definition is equivalent to this one:

1. We can show that the morphism $\Gamma_f \to X$ is quasi-finite and that the morphism $\Gamma_f \times \mathbb{A}^1 \to X \times \mathbb{A}^1$ is quasi-finite.

2. We can show that when both these morphisms are quasi-finite, then the morphism $\Gamma_f \rightarrow X$ is finite.

The usual definition of a morphism

$$V(X_1,\ldots,X_p;f_1,\ldots,f_q) \rightarrow V(Y_1,\ldots,Y_k;g_1,\ldots,g_l)$$

is to give polynomials $h_i(X_1, \ldots, X_p)$ for $i = 1, \ldots, k$ such that $g_j(h_1, \ldots, h_k)$ lies in the ideal generated by f_i . One can show that the earlier definition is equivalent to this one:

- 1. We can show that the morphism $\Gamma_f \to X$ is quasi-finite and that the morphism $\Gamma_f \times \mathbb{A}^1 \to X \times \mathbb{A}^1$ is quasi-finite.
- 2. We can show that when both these morphisms are quasi-finite, then the morphism $\Gamma_f \rightarrow X$ is finite.
- 3. We can show that a finite morphism which is bijective on points on finite rings is an isomorphism.

The usual definition of a morphism

$$V(X_1,\ldots,X_p;f_1,\ldots,f_q) \rightarrow V(Y_1,\ldots,Y_k;g_1,\ldots,g_l)$$

is to give polynomials $h_i(X_1, \ldots, X_p)$ for $i = 1, \ldots, k$ such that $g_j(h_1, \ldots, h_k)$ lies in the ideal generated by f_i . One can show that the earlier definition is equivalent to this one:

- 1. We can show that the morphism $\Gamma_f \to X$ is quasi-finite and that the morphism $\Gamma_f \times \mathbb{A}^1 \to X \times \mathbb{A}^1$ is quasi-finite.
- 2. We can show that when both these morphisms are quasi-finite, then the morphism $\Gamma_f \rightarrow X$ is finite.
- 3. We can show that a finite morphism which is bijective on points on finite rings is an isomorphism.

This proof is much to long to present here and also goes outside the topos of finite sets!

Further justification for this approach to the study of schemes can be seen from the fact that we have just defined schemes entirely in terms of their points over finite (commutative) rings.

Further justification for this approach to the study of schemes can be seen from the fact that we have just defined schemes entirely in terms of their points over finite (commutative) rings. This gives credence to the belief that most geometric concepts can be derived just from knowing this information. What happens if we replace C by \mathcal{R} ?

Further justification for this approach to the study of schemes can be seen from the fact that we have just defined schemes entirely in terms of their points over finite (commutative) rings. This gives credence to the belief that most geometric concepts can be derived just from knowing this information.

What happens if we replace C by \mathcal{R} ? This appears to be a possible approach to talking about non-commutative algebraic geometry.
